BAJEYE™

IN BRIEF: Laptops, satellite offices and remote workers are becoming more commonplace as technology allows a distributed work environment. An organization's usage policies must be in place at all times, as must their Online Activity Management solution. A client-based management solution is the only way to ensure that policies are adhered to when resources are mobile and distributed.

BajEye™ provides advanced Internet online activity management controls and detailed web categorization for your satellite employees and traveling laptops. Residing on the client, as a system level access control application, BajEye™ provides authorization for URL requests based on flexible individual criteria. Once in place, administrators have the ability to effectively manage Internet access regardless of the resource location.

FEATURES AND BENEFITS

Eliminate costly communication infrastructure
BajEye™ alleviates the need for costly 1-800 and long distance phone plans by maintaining your access management needs on the client. This technology advancement provides your offsite resources the ability to use existing local (calling) connections to reach your internal networks via the Internet for no additional cost.

Manages online activities regardless of connection type
Because BajEye™ is a system level activity management tool, the type of connection (Ethernet or a personal dial up account) is irrelevant. This ensures your policy management is always in place.

Quick and easy setup and configuration
Built with an intuitive management interface, BajEye™ installs in minutes and can be configured with a few simple mouse clicks. BajEye™ ensures your traveling resources are covered and online activities are aligned with your policy.

Chat and newsgroups
Because your internal infrastructure (firewalls etc.) is not used when your resources are on the road, BajEye™ provides management capabilities for newsgroups as well as chat protocols such as AOL Instant Messaging, IRC, MS Instant messenger, and ICQ.

Automatic list updating
Utilizing the same methods as ProxEye for list update, BajEye™ refreshes its lists under any Internet connectivity. BajEye™ ensures these commonly overlooked resources maintain the same level of protection as your in-house systems.

Uses OCULAR™ technology
Using the fastest request analysis engine on the market today, BajEye™ will not hamper the performance of your laptops.

Supporting Features

- The most extensive lists generated by iajaBot™, using OCULAR™ technology
- Allows custom overrides, and full control over access
- Allows trade secret protection on chat channels
- Allows JavaScript protection (prevents annoying advertising windows)
- Allows for activity logging
- FREE Internet trend software updates
- Allows for white list only option
- Added tamper resistant features for Windows 95/98/Me
- Artificial Intelligence

Minimum System Requirements
Windows 95 or greater with Winsock 2 update
Approximately 20MB of hard disk space (for the URL database)
BajEye has a 100-kilobyte memory requirement, and thus does not impact your current Windows system.
